

Severe Asthma Roadmap for Improved Diagnosis and Personalized Treatment

– A Guided Workflow

MOUNT SINAI - NATIONAL JEWISH HEALTH
Respiratory Institute

DOES THE PATIENT HAVE ASTHMA?

- Confirm variable airflow limitation: review/repeat pulmonary function tests with bronchodilator
- Consider methacholine or exercise challenge tests if spirometry inconclusive and clinical response to treatment is absent or limited
- Exclude other conditions (eg, airway tumor, foreign body, COPD, bronchiectasis, vocal cord dysfunction, CF, aspiration)

AN ASTHMA DIAGNOSIS IS CONFIRMED

1 Asthma education and health maintenance

- Educational action plan
- Self-management plan
- Vaccination
- Smoking cessation
- Healthy lifestyle (diet, exercise, sleep)

2 Identify patient-related factors

- Disabilities, age, poor general health
- Poor health literacy
- Lack of access to health care
- Inability to afford medication

3 Diagnose and manage comorbidities

- Rhinosinusitis/nasal polyps
- Gastroesophageal reflux
- Obstructive sleep apnea
- Vocal cord dysfunction
- Allergic bronchopulmonary aspergillosis
- Eosinophilic granulomatosis with polyangiitis (previously known as Churg-Strauss syndrome)
- Obesity
- Psychological factors (personality, depression, anxiety)
- Drug side effects: aspirin, NSAIDs, beta-blockers, ACE inhibitors
- Aspiration

4 Address environmental factors

- Allergen exposures (indoor, outdoor, pets)
- Occupational exposures
- Respiratory infections (eg, viruses)
- Second-hand cigarette smoke
- Traffic-related pollution
- Respiratory irritants

5 Optimize inhaled therapy

- Choose best device for patient
- Check inhaler technique frequently
- Correct patient's inhaler technique

6 Maximize adherence and minimize side effects

- Assess knowledge and attitudes about medication
- Assess barriers to proper medication use
- Acknowledge patient beliefs about medications
- Teach ways to improve adherence
- Ask and educate about possible side effects
- Use strategies to reduce side effects (eg, spacers for MDIs)

IS ASTHMA UNCONTROLLED, DESPITE STEPPING UP TO A HIGH-DOSE ICS + LABA?

- Poor symptom control (ACQ > 1.5, ACT < 20, or per GINA/NAEPP guidelines)
- ≥ 2 bursts of systemic corticosteroids for asthma exacerbations in the past year
- ≥ 1 hospitalization for asthma in the past year
- FEV1 < 80% predicted when not taking short- or long-acting bronchodilators
- Asthma is uncontrolled when any 1 of the 4 criteria above is present - consider referral to asthma specialist

Close follow-up.
Reduce treatment intensity after at least 3–6 months of stable, good control, per GINA/NAEPP guidelines

Consider adding a non-biologic therapy

- Tiotropium
- Leukotriene modifier
- Theophylline
- Macrolide antibiotic
- Oral glucocorticoid (short course)

IS ASTHMA STILL UNCONTROLLED, DESPITE TREATMENT WITH HIGH-DOSE ICS + LABA AND A NON-BIOLOGIC ADD-ON THERAPY?

SEVERE ASTHMA: INFLAMMATORY PHENOTYPES AND TREATMENT APPROACHES

Inflammatory Phenotype	Common Clinical Features	Biomarkers in Patients Receiving High-Dose ICS	Add-on Pharmacologic Maintenance Therapies	Additional Strategies to Consider*	
Type 2 (Th2) inflammation	IL-4, IL-5, IL-13 mediated inflammation with high eosinophils or FENO	<ul style="list-style-type: none"> • Early onset, allergic, with elevated IgE level • Later onset, obesity, female sex, variable airflow obstruction • Exacerbations • Nasal polyps 	<ul style="list-style-type: none"> • Blood eosinophil count ≥ 300/μL • FENO ≥ 20 ppb • Sputum eosinophils ≥ 2% 	<ul style="list-style-type: none"> • Anti-IgE <ul style="list-style-type: none"> • Omalizumab (If IgE = 30-700 IU/mL and IgE-mediated hypersensitivity to a perennial allergen) • Anti-IL-5 <ul style="list-style-type: none"> • Mepolizumab • Reslizumab • Anti-IL-5Rα <ul style="list-style-type: none"> • Benralizumab • Anti-IL-4Rα <ul style="list-style-type: none"> • Dupilumab 	<ul style="list-style-type: none"> • Maximize treatment of coexisting conditions associated with Th2 inflammation (eg, rhinosinusitis, AERD, ABPA)
Non-Type 2 inflammation	Neutrophilic airway inflammation	<ul style="list-style-type: none"> • Poor response to ICS • Purulent sputum • Bronchiectasis • Low lung function 	<ul style="list-style-type: none"> • Sputum PMNs ≥ 40–60% 	<ul style="list-style-type: none"> • No phenotype-specific treatment currently available • Treat infections • Consider macrolide antibiotics 	<ul style="list-style-type: none"> • Address exposures (smoke, irritants, pollutants) and altered microbiome • Mucus-clearance strategies • Consider Bronchial Thermoplasty
	Paucigranulocytic (noninflammatory) asthma	<ul style="list-style-type: none"> • Fixed or variable airflow obstruction 	<ul style="list-style-type: none"> • No Th2 biomarkers and sputum PMNs ≤ 40–60% 	<ul style="list-style-type: none"> • No phenotype-specific treatment currently available 	<ul style="list-style-type: none"> • Nonpharmacologic strategies (including pulmonary rehabilitation) • Consider Bronchial Thermoplasty
Possible Th2 inflammation	Mixed eosinophilic and neutrophilic inflammation	<ul style="list-style-type: none"> • Features of both eosinophilic and neutrophilic airway inflammation 	<ul style="list-style-type: none"> • Th2 and neutrophilic markers 	<ul style="list-style-type: none"> • Trial of macrolide antibiotics† for 3–6 months 	<ul style="list-style-type: none"> • Maximize treatment of coexisting conditions associated with Th2 and non-Th2 inflammation (eg, rhinosinusitis, infections)

*Assumes that alternative diagnoses have been excluded, comorbidities have been identified and managed, patient-related factors and environmental exposures have been addressed, inhaled therapy and adherence have been optimized, and non-biologic therapy has been considered or tried (see Roadmap for details).

Abbreviations: **ABPA**, allergic bronchopulmonary aspergillosis; **AERD**, aspirin-related respiratory disease; **FENO**, fractional nitric oxide concentration in exhaled breath; **ICS**, inhaled corticosteroid; **IgE**, immunoglobulin E; **IL**, interleukin; **PMN**, polymorphonuclear leukocyte; **Th2**, T-helper 2.

DETERMINE INFLAMMATORY PHENOTYPE/ ENDOTYPE

- Start with non-invasive testing (allergy testing, IgE level, blood eosinophil count and FENO level)
 - If poor response to therapy continues, consider induced sputum differential for eosinophil and neutrophil counts and/or bronchoscopy with endobronchial biopsy and BAL
- See Table for Description of Phenotype**
