Prevent and reduce atopic dermatitis (eczema) symptoms by putting water back into the skin every day.

**Soak in the bathtub for 15–20 minutes.**
- Use warm water (not hot)
- Use a gentle cleanser and do not scrub the skin.
- Cover areas not covered by water with wet towels or washcloths.

**TIPS**
- Do soak and seal every day
- Pat (don’t rub) skin dry after soaking
- If rash present, can increase soak and seal to twice daily

**Seal**
- Apply the moisturizer or medication recommended by your healthcare provider
- Moisturizers are used after soaking and also when skin feels dry or itchy
- Try to apply moisturizer or medication within three minutes of patting dry, while water droplets are still on skin
- Medications are used if itch, rash or infections occur – use them as prescribed and don’t substitute
- In severe eczema cases, your doctor may add wet wrap therapy

**Lotion**
- Pieces of clothing or dressings soaked in warm water then applied to skin after soak and seal
- Only used when eczema rash is severe
- Your doctor must show you the proper technique
