

Epinephrine Injection:

The quick, easy-to-use shot

*that could save lives.**
It's not the last resort!

WHAT Is Epinephrine?

Also known as adrenaline, epinephrine is a hormone our body makes naturally, and it is used to treat severe or life-threatening allergic reactions known as anaphylaxis. Anaphylaxis can occur after exposure to allergens such as:

- Food
- Insect stings
- Medications

WHEN When to Use Epinephrine

At the first sign of a severe allergic reaction. Signs of a reaction include:

- Difficulty swallowing or drooling because you can't swallow
- Coughing, difficulty breathing or chest tightness
- Repeated vomiting or significant abdominal pain

HOW to Use an Epinephrine Injector*

1 Hold the auto-injector tightly in a fist. Remove the blue safety cap from the top end.

2 Place the orange end of the device against the middle of the outer thigh and push firmly.

3 Keep the pen pressed firmly against the thigh for 3 seconds.

4 Remove pen and massage the injection area.

*Always follow the manufacturer's instructions for the specific injector you are using.

AFTER USE

- Get emergency medical help right away
- Make sure a second injection is nearby; if symptoms continue or come back within 10–15 minutes, you may need another dose
- Take (or give your child) an antihistamine

TYPES OF EPINEPHRINE

Common brands include:

- EpiPen® Auto-Injector
- EpiPen® Jr. Auto-Injector

TIPS

- Carry two auto-injectors with you at all times
- You can inject through your clothing
- Epinephrine is a very safe medicine. If you think you need it, use it.

*This applies to EpiPen and generic epinephrine autoinjectors made by Viatris and Teva Pharmaceutical Industries.
