In 1907 a group of Denver women founded the Denver Sheltering Home, which cared for children whose parents were receiving care for tuberculosis at National Jewish and other institutions.

Before antibiotics, tuberculosis patients, like these at National Jewish in 1905, often slept outside because fresh air and sunshine were thought to be keys to successful treatment.

In the 1950s, Dr. Werner Shaefer improved methods for diagnosis of tuberculosis and the related non-tuberculous mycobacterium diseases.

Community outreach programs at National Jewish Health help asthma patients monitor and manage their disease.

Today, in the Minimally Invasive Diagnostic Center, physicians use detailed CT scans and advanced navigational software to plan their bronchoscopic procedures.

The new Institute for Advanced Biomedical Imaging™ offers advanced imaging capabilities for improved patient care and research.

The original National Jewish Hospital for Consumptives opened in 1899.

Early patient on a private porch. Fresh air and sunshine were vital components of early TB treatment.

For almost two decades, from 1948 to 1968, National Jewish physicians performed pioneering cardiac surgery.

Children come from around the country to the Pediatric Day Program at National Jewish Health, a unique, program for treatment of severe asthma, eczema, food allergies and related diseases.

The mycobacteriology laboratory at National Jewish Health is one of the world’s leading laboratories in the diagnosis and drug-susceptibility testing of TB and related diseases.

The main National Jewish Health campus comprises 13 buildings on 16 acres.

The B’nai B’rith building, opened in 1926 as an infirmary, now houses administrative offices, the Quitline and Fitlogix™ telephonic services, and clinical laboratories.

Dr. Alfred Japha, chief pediatrician during the 1940s, was a kindly and astute man who was adored by children and parents alike.

Loving care has always been an important component of pediatric treatment at National Jewish Health.

The recently established cardiology division offers a wide variety of consultative, evaluative and diagnostic services.

Specialized equipment allows rheumatologists to look closely at the hand for evidence of rheumatoid arthritis and other rheumatological diseases.

Greg Downey, MD played an instrumental role in forming a partnership with Siemens Healthcare, which brought state-of-the-art imaging capabilities to National Jewish Health.

Our past two annual reports have chronicled our strategic planning process: highlighting our priorities 18 months ago, then outlining last year the commitments we made in Decade of Innovation: Strategic Plan 2017. This year, we tell you about the significant accomplishments we have made in delivering the promises of the strategic plan for National Jewish Health.

It has indeed been an extraordinary year. We put in place several of the crucial institutional elements that will underpin our pioneering effort to lead in the field of preventive, personalized medicine from our Institute for Advanced Biomedical Imaging™ to our Minimally Invasive Diagnostic Center and the Integrated Bioinformation and Biospecimen Center. We also invested in human capital, bringing on board several of the people who will lead our efforts in the coming decade.

At the same time our operations flourished. Clinical revenues grew by almost 24 percent. Our research endeavors continued to grow in spite of flat NIH budgets. Fundraising efforts continued to bear significant fruit, even in this time of economic uncertainty. You can find details of our financial performance on page 58.

We are not immune, however, to the prevailing economic winds, as evidenced by the recent decline in value of our investments. We must be prepared for challenges to both our investments and to charitable giving in the coming year. We are grateful to our friends and supporters around the world who make what we do possible at National Jewish Health. To that end, we plan to rigorously manage expenses, scrutinizing the need for new positions and capital expenses until we can see more fully over the horizon.

Fortunately, we believe we are well positioned to face the turmoil ahead, thanks in large part to our extraordinary faculty and staff. Every day it is they who deliver a unique and transformative healthcare experience to our patients that improves the quality of their lives. In addition, our science and discovery-based collegial culture allows us to innovate in medicine and science, which will drive our continued growth.

One evident innovation during the past year is our new name and new logo. Those are parts of a rebranding effort that seeks to align our identity with our strategic goals, and to create a national brand that is familiar to patients, donors and colleagues from coast to coast. You can read more about the thinking that went into the name, the logo and our brand promise, Science Transforming Life®, on page 4.
In last year’s report, we identified the three institutional pillars crucial to our future success: The Institute for Advanced Biomedical Imaging™, the Integrated Bioinformation and Specimen Center, and the Center for Genetics and Therapeutics.

The Institute for Advanced Biomedical Imaging™ (page 6), created in partnership with Siemens Healthcare, brings state-of-the-art imaging capabilities to National Jewish Health. In addition to providing the best possible imaging to our patients, this new technology will be a vital research tool as we strive to bring imaging seamlessly together with our diagnostic laboratories. We are already using it extensively in COPDGene (page 7), the massive NIH study we are leading to better understand the chronic obstructive pulmonary disease and discover new therapies. With our alliance partners Siemens Healthcare, we have embarked on an ambitious research agenda to further improve imaging and its diagnostic capabilities.

The Integrated Bioinformation and Specimen Center (pages 8-9) brings together vast amounts of invaluable data and tissue samples into a combined, linked repository and database. We are one of very few institutions in the nation that have assembled such a unified and powerful research resource.

The Center for Genetics and Therapeutics will drive genetic discovery at National Jewish Health, which is at the heart of our plan to pioneer personalized medicine. David Schwartz, MD, one of the world’s foremost experts in the genetics of pulmonary disease, left his position as Director of the National Institute of Environmental Health Sciences and the National Toxicology Program to develop and lead this center at National Jewish Health.

In addition to our coup in attracting Dr. Schwartz, you can also read on page 11 about Susan Holt, our new Vice President of Development, and Ron Berge, our new Executive Vice President and Chief Operating Officer. Both of these seasoned leaders have played transformative roles in the previous positions at academic medical centers.

Ali Musani, MD, one of the world’s leading practitioners of the emerging field of interventional bronchoscopy, joined us from the University of Pennsylvania to develop and lead our new Minimally Invasive Diagnostic Center (page 12). You can read how he helped save the life of Hazel Rutter by diagnosing her lung cancer early enough so that it could be cured.

Preveen Ramamoorthy, PhD, also joined National Jewish Health in the past year to create and operate the Molecular Diagnostics Laboratory. On page 14, you can read how he and his colleagues developed a new diagnostic test that can help predict which patients will be helped by the asthma medication montelukast. This kind of test exemplifies personalized medicine, allowing us to treat patients proactively, rather than reactively in a trial-and-error manner.

These are just some of the stories of growth and innovation that abound at National Jewish Health. Thumb through these pages and you will see many more. At National Jewish Health, the decade of innovation is off to a very promising start.
ELEVATING THE NATIONAL JEWISH BRAND
A new strategy calls for an updated identity

With the adoption of a new 10-year strategic plan, National Jewish Health has embarked on an ambitious venture to transform not only our institution but the practice of medicine itself. We are investing millions of dollars to strengthen our infrastructure, to develop new products and services, and to recruit clinicians and scientists to lead the development of preventive, personalized healthcare. These dramatic changes occurring at National Jewish Health called for an updated brand.

What is a brand? It is a promise — a big organizing idea that helps people understand who we are and where we are going. A great brand connects emotionally, making people want to associate with us. It encourages great people to work for us, patients to trust us with their care, donors to support our endeavors, and companies, governments and foundations to fund our research. Our current brand is good. We aspire to make it great, a national brand that is aligned with our strategic objectives.

Our name, our brand promise and our logo are three of the most visible embodiments of our new brand.

Our Name
We have changed our name several times in our history, starting with The National Jewish Hospital for Consumptives in 1899, progressing through National Jewish Hospital/National Asthma Center and National Jewish Medical and Research Center. The one thing all these names had in common was National Jewish, the two words that define us. When you say National Jewish, it’s a proud and successful name that is core to our history and identity.

However, the descriptor part of our name, Medical and Research Center, was holding us back. It did not reflect the wider reach of our strategic plan into new areas of health beyond research and treatment. It also limited us to a single site or campus and did not convey our widening geographic strategy.

‘Health’ is a better descriptor. It aligns with our organizational strategy to move toward personalized, proactive health and preventive medicine. Health also better describes our growing network beyond site-specific descriptors, such as hospital or medical center. Additionally, Health differentiates us better than those more common descriptors. That is why we chose to rename ourselves National Jewish Health.

We want people to know we’re more than a care or research site — we’re about a whole new way of helping people live better lives through better health. At the same time it retains our National Jewish heritage in a powerful articulation that is easy to remember.

Our Brand Promise
A brand promise is the articulation of the benefits that we will deliver every time someone comes into contact with our brand. It’s the one central idea that guides our organization. When we started to develop a brand promise, it made sense to start with science — National Jewish Health has a strong research and discovery-driven culture. It’s the bedrock of who we are. The next element incorporates our reputation to lead, educate and leverage our scientific expertise to transform research into care, and to transform the lives of our patients. The third and final element of our brand promise is the impact of transformational science to create personalized life medicine that improves the health of individuals and communities. Thus, Science Transforming Life®.

You’ll see Science Transforming Life® used as a tagline, as a codification of our evolution and our strategy. However, Science Transforming Life® is more. It is a promise to create an entirely new health category. It’s about science being leveraged to change lives.
Our Logo

Every element of our new logo was carefully and methodically chosen for a specific reason — to trigger a unique and differentiated identification of National Jewish Health.

The blue line swirls into one side of a helix shape, to convey our scientific excellence, and also creates part of a healthy human being. Cool blue is the color of stability, credibility and clinical excellence.

Orange, a new warm color for us, is taken from the color of fire — representing the flame of knowledge, teaching and learning, and its transformative power. The orange counter-swirl crosses the blue, completing a stylized helix shape and forming the rest of the body of a human figure. Together, the intertwined blue and orange strokes also subtly convey the multi-disciplinary and collaborative culture we are building.

The final stroke of our new logo is the blue head of the person. It completes the logo as a symbol of the human lives that we seek to improve. You’ll notice that the human figure is not standing still, but leaning or moving forward in a healthy, dynamic way, evoking the image of an athlete winning a race, which alludes to our vision to win the race for new cures and better health.

With a new vision and a new brand, we move forward proudly and confidently. We hope this new excitement will be embraced by all who visit, support, and work with us at National Jewish Health.
INSTITUTE FOR ADVANCED BIOMEDICAL IMAGING™ OPENS

Partnership with Siemens Healthcare brings state-of-the-art imaging and collaborative research

In 2008 National Jewish Health vastly upgraded its imaging capabilities with the opening of the Institute for Advanced Biomedical Imaging™. The Institute is the first obvious benefit of a strategic alliance National Jewish Health formed with Siemens Healthcare, one of the world’s foremost imaging and diagnostic companies.

“Siemens Healthcare will be a terrific and innovative partner in furthering our common vision of personalized medicine,” said Michael Salem, MD, President and CEO of National Jewish Health. “This alliance will be a major advance for both our faculty and our patients.”

With more powerful imaging equipment and new software to process and display the images, the Institute has immediately improved the patient care at National Jewish Health. An agreement to collaborate on research promises to improve imaging and diagnostic technology in the future.

The new Institute brings a more powerful MRI machine, a faster and higher-resolution CT scanner, and a combined PET/CT scanner to National Jewish Health. The new CT scanners improve not only the resolution of the images taken of patients’ lungs, but also allows patients to hold their breath for shorter periods, an important consideration for so many of our patients with heart and lung disease. The PET/CT scanner allows radiologists to combine the diagnostic power of PET scanners, which detect metabolic activity, with the detailed structural information available from CT scanners. For instance, a CT scanner can exactly locate a suspicious lesion in the lungs, and the PET scanner can offer valuable information about whether it is likely to be cancer, infection or scarring. Several cases of early stage lung cancer were detected during the first weeks that the PET/CT scanner was operating. The new MRI machine is especially useful for imaging hearts, helping physicians determine whether it is the heart or lungs that are causing patients breathing problems.

“We now have the ability to dig deeper into each patient’s individual condition and customize solutions to their situation.”

In addition to the immediate benefits to patients, National Jewish Health and Siemens Healthcare are collaborating on research projects that promise to improve the science of imaging. One project seeks to improve detection of potentially cancerous lung nodules. It is known that people at high risk for lung cancer have many lung nodules smaller than 10 millimeters in diameter. However,
COPD Studied on a Grand Scale

Researchers from National Jewish Health were awarded a $25 million grant from the National Heart Lung and Blood Institute (NHLBI) to lead the most comprehensive study of chronic obstructive pulmonary disease (COPD) ever undertaken. COPD is an umbrella term for a variety of progressive lung diseases, caused primarily by cigarette smoking, which damages lung tissue and makes it difficult to breathe.

The study will seek to better identify specific subgroups of COPD patients with the long-term goal of better understanding the disease and finding more effective treatments. Researchers will characterize the genetic, epidemiological and radiological characteristics of 10,000 patients.

“COPD is the fourth leading cause of death in the United States, and on the rise, yet we know so little about the disease,” said James Crapo, MD, Professor of Medicine at National Jewish Health and principal investigator of the study. “This study will help us determine which smokers are most at risk of developing the disease, who is most likely to have progressive disease, and how to more effectively treat it.”

Brigham and Women’s Hospital in Boston has received $12 million from NHLBI for a study that is closely related and linked to the National Jewish Health study.

current imaging technologies cannot reliably detect those. National Jewish Health and Siemens are working together to develop techniques for detecting 4- to 8-millimeter nodules and determine whether they are likely to be malignant. Earlier detection of lung cancer holds promise of greatly reducing deaths from the disease.

Another collaboration supports the development of a tool, called a phantom, that can be used to uniformly calibrate imaging machinery at different locations. This is especially helpful for multi-site research projects, and will be used in the massive COPDGene project that National Jewish Health researchers are leading. In the planning stages is a research project to develop quantitative imaging techniques, which can improve diagnostic capabilities. Researchers are also planning a project to improve imaging of the right side of the heart, which is especially important for many National Jewish Health patients because it pumps blood to the lungs.

“Working with Siemens Healthcare gives us the potential to transform the practice of medicine,” said Greg Downey, MD, Executive Vice President of Academic Affairs. “State-of-the-art technology, combined with our expert radiologists and collaborative research projects will help us usher in a new era of personalized medicine.”
A MILLION POINTS OF INFORMATION

Tissue repository and database unify data into a single powerful resource for research

Everyday at National Jewish Health hundreds, if not thousands, of tissue samples, diagnostic images, measurements and tests are taken during the course of patient care. They are recorded in each patient’s medical chart and used to diagnose, evaluate and plan care. But until recently they existed in isolated files, beneficial only to the individual patients.

In an extraordinary institutional effort, National Jewish Health has brought together millions of data points and thousands of tissue samples from patients and research subjects into a single Integrated Bioinformation and Specimen Center, or “biobank.”

“The biobank will support a new era of cutting-edge research that could benefit patients around the globe,” said Greg Downey, MD, Executive Vice President of Academic Affairs, who oversaw the creation of the biobank. “Few, if any, other institutions have such a comprehensive research resource.”

The tissue repository consists of a newly built facility in the basement of the Iris and Michael Smith Laboratories and Clinics with dozens of liquid nitrogen freezers at -80 degrees centigrade. These currently contain about 7,000 tubes of blood, urine, lung fluid, and other specimens collected from patients at National Jewish Health. Up to 100,000 samples will be collected.

The database that contains the information about the specimens is what gives this biobank its rare and extraordinary power. While tissue repositories exist at other institutions, they are almost never brought together into a unified repository and typically contain extremely limited information. For instance, at most institutions, a sample might be marked simply “COPD patient.”

At National Jewish Health, however, the Division of Biostatistics and Bioinformatics pulled together information from dozens of different information sources, including the newly adopted electronic medical records, into a single, carefully designed database. Hundreds of data points about that patient’s health, test results, imaging records, and response to therapies are attached to each sample. All names and personal identifiers are kept anonymous by a system that assigns a bar code and randomly generated ID number to samples at the time of collection. Moreover, the database is searchable based on all of the characteristics it tracks.

“If a researcher wants to study the effect of a certain medication on female asthma patients aged 30-50 with a particular genetic characteristic, they can easily do that,” explained James Murphy, PhD, Head of the Division of Biostatistics and Bioinformatics. “This gives researchers tremendous power.”
At this time, National Jewish Health is collecting samples from patients with asthma, hypersensitivity pneumonitis, allergic rhinitis, atopic dermatitis, and industry-related diseases such as berylliosis, silicosis, and asbestosis. Within the next one to two years, all National Jewish Health patients will be invited to contribute extra tubes of blood or bronchial fluid to the developing tissue repository.

The value of tracking multiple measurements over time can not be overstated. Monitoring outcomes in patients with a specific genetic makeup could help scientists predict or diagnose disease, or predict a person’s response to therapy based on genetic biomarkers. National Jewish Health pediatric researchers have already used the database to identify a set of immune-system proteins that appear to identify a group of children with asthma who have obstructed lung function. The group then used the database to validate their findings in an independent series of patients. The next step will be a study to see if these biomarkers can be used to predict long-term outcomes in such children.

“These kinds of studies may lead to the development of non-invasive tests to detect disease even before symptoms arise,” said Dr. Downey. “Patient care is going to be transformed by studies like these.”

**Lymphoma Discovery Points to Potential Therapy**

Non-Hodgkins lymphoma, cancer of immune-system cells, has become 85 percent more prevalent in the past 20 years, the only major form of cancer to experience such growth. About 66,000 new cases of non-Hodgkins lymphoma are diagnosed each year in the United States, and roughly 20,000 people die of it.

Yosef Refaei, PhD, Assistant Professor of Pediatrics and Immunology, and his colleagues discovered an important factor in the development of B-cell lymphomas, which account for about 90 percent of non-Hodgkins lymphomas.

It has long been known that the oncogene MYC plays a crucial role in the development of lymphomas. Dr. Refaei demonstrated that the B-cell receptor, on the surface B cells, is also necessary, cooperating with MYC in the development of tumors. Dr. Refaei’s study also showed that immunosuppressants, which disrupt signals from the B-cell receptor, can inhibit growth of the tumors.

“Our findings have pointed to the B-cell receptor and its signaling pathways as very promising therapeutic targets for B-cell lymphomas,” said Dr. Refaei.

Thousands of tissue samples in the Integrated Bioinformation and Specimen Center are stored in freezers kept at -80 degrees centigrade. Each sample is linked to a database containing hundreds of data points about the sample and the patient it came from. Together, the specimens and databank offer a research resource of immense power.
NEW GENETICS CENTER CRUCIAL TO PERSONALIZED MEDICINE

David Schwartz, MD, joins National Jewish Health to lead Center for Genetics and Therapeutics

With the recent decoding of the human genome, the stage has been set for great insight into the causes of health and disease, and the genetic variations that influence individual patients’ health. David Schwartz, MD, came to National Jewish Health in early 2008 from his leadership position with the National Institutes of Health (NIH) to develop and lead the Center for Genetics and Therapeutics, which will spearhead genetic discovery at National Jewish Health. Dr. Schwartz also serves as Director of the Pulmonary and Critical Care Division at National Jewish Health.

“The Center for Genetics and Therapeutics will help us understand how genes work in biological systems, how genetic variants contribute to the development of disease, and why individuals with the same disease have very different clinical outcomes,” said Dr. Schwartz. “These discoveries will allow clinicians to more effectively diagnose problems in their patients and to target therapy to reduce risk and enhance the response.”

Before coming to National Jewish Health, Dr. Schwartz served as Director of the National Institute of Environmental Health Sciences and the National Toxicology Program, where he developed programs in environmental genetics, translational research, and epigenetics. Prior to his work at the NIH, he served as the Director of the Pulmonary, Allergy, and Critical Care Division, and Vice Chair of Research in the Department of Medicine at Duke University. At Duke, Dr. Schwartz played a principal role in developing three interdisciplinary centers in environmental health sciences, environmental genomics and environmental asthma. He has also enjoyed a productive research career, focusing on the epigenetics of asthma, the genetics of familial pulmonary fibrosis, and innate immunity. He is recognized as one of the foremost experts on the genetics of pulmonary disease.

“I was attracted to the tremendous resources available at National Jewish Health, especially the outstanding physician scientists and basic investigators — many of whom I have known and respected for decades — and the Integrated Bioinformation and Specimen Center (see pages 8-9),” said Dr. Schwartz. “We have a unique opportunity to lead the field of genetic discovery for the diseases we treat.”

In his first months at National Jewish Health, Dr. Schwartz has been busy developing research plans with faculty from all corners of the institution, recruiting new faculty members to staff the center, and establishing his own lab.

“Being in this environment is very, very exciting,” said Dr. Schwartz. “The people and support here have been exceptional.”
The Senior Executive team at National Jewish Health benefited in 2008 from the addition of two executives capable of transforming institutions: Susan Holt as Vice President of Development, and Ron Berge as Executive Vice President and Chief Operating Officer.

Susan Holt has transformed several academic medical institutions with her fundraising prowess, especially through very large donations, or “mega-gifts.” She spent 16 years at Vanderbilt University Medical Center where she helped secure more than $200 million for a comprehensive cancer center, including a founding donation of more than $100 million. She created a major gifts program for the basic sciences program and served as the principal gifts officer for the medical center’s $625 million campaign. She also held senior positions at Case Western Reserve University School of Medicine and the Weill Cornell Medical College, where she served as the Chief Development Officer and managed a $1.3 billion campaign that raised more than $700 million in nine months. “This is an especially exciting time as National Jewish Health, with its many philanthropic partners, implements a bold new vision,” said Holt.

Ron Berge’s experience transforming medical institutions resides in a different sphere: the physical one. Capping a 20-year career at The Children’s Hospital in Denver, Berge directed the design and construction of the hospital’s 43-acre new hospital campus, outpatient pavilion, clinical and research laboratories, behavioral health pavilion, and office complex, a $560 million project that has received rave reviews.

Since joining National Jewish Health in early 2008, Berge has worked to complete the final touches on the new Minimally Invasive Diagnostic Center, and the design and construction of the new Institute for Advanced Biomedical Imaging™.

Berge is charged with developing a plan to provide the physical wherewithal to turn the National Jewish Health strategic plan into a concrete reality. The next big task is working on master campus planning. Berge will collaborate with leadership and staff to identify growth needs and opportunities. “It is important that we anticipate challenges and identify opportunities to grow,” said Berge.

David Schwartz, MD, (page 10) has begun to tap resources throughout National Jewish Health as he launches the Center for Genetics and Therapeutics, which will seek to understand the genetics of complex respiratory, immune and related diseases. Ron Berge and Susan Holt (page 11) will contribute to the transformation of National Jewish Health as Chief Operating Officer and Vice President of Development.
MINIMAL INVASION, MAXIMAL RESULTS
Ali Musani makes vital diagnosis earlier and with less trauma

As a histology technician for National Jewish Health many years ago, Hazel Rutter had seen firsthand the work that makes National Jewish Health a global leader in research and care. That is why she reached out to James Fenton, MD, at National Jewish Health South Denver when she needed care. She didn’t realize she would be one of the first to undergo an interventional bronchoscopy in the new state-of-the-art Minimally Invasive Diagnostic Center (MIDC).

A CT scan taken at National Jewish Health South Denver showed a lesion in Rutter’s upper left lung. It looked like pneumonia, but Dr. Fenton was not certain. He suspected the lesion might be cancer. A biopsy could tell for sure, but the location of the lesion would have required invasive surgery to open up Rutter’s chest. In cases like Hazel’s, physicians traditionally weigh the risks of an invasive operation against the unnerving option of watchful waiting to see if the lesion grows.

Fortunately Dr. Fenton and Rutter had a better option — Dr. Ali Musani and the newly opened Minimally Invasive Diagnostic Center at the main National Jewish Health campus. Dr. Musani, who came to National Jewish Health in early 2008, is a world leader in interventional pulmonology, an emerging field that takes advantage of advancing technology to perform a variety of outpatient procedures that previously required invasive surgery and a stay in the hospital.

“A minimally invasive approach combined with mind-boggling technology allows interventional pulmonology to achieve what was unimaginable just a few years ago,” said Dr. Musani.

The procedures Dr. Musani performs are most commonly done with a bronchoscope inserted in the patient’s airway. A growing range of tiny tools, including a high-definition camera, ultrasound probe, lasers, needles and forceps, can be threaded through the bronchoscope to guide and perform the procedures both inside and near the airways. In addition, Dr. Musani can use a Super Dimension navigation system to find even very tiny nodules deep within the lungs.

Dr. Musani and his colleagues in the MIDC provide a variety of diagnostic, therapeutic and palliative procedures, including the early diagnosis and staging of lung cancer, treatment of airway obstructions caused by cancer and other disorders, removal of foreign bodies from the lungs, and the placement of stents in the airways.

“It is a tremendous benefit to patients that we can perform these procedures more quickly and safely than before,” said Dr. Musani. “For many of our patients we are able to perform minimally traumatic procedures that their bodies might not otherwise be able to handle.”
Dr. Musani was able to thread his bronchoscope deep within Rutter’s lungs to the suspicious lesion and obtain a small piece of tissue that turned out to be cancerous.

“Ms. Rutter’s case demonstrated the collaboration between specialists at the National Jewish Health locations,” said Dr. Fenton. “Dr. Musani’s expertise and the advanced technology at the Minimally Invasive Diagnostic Center give us many more options for personalized patient care.”

Thanks to the early diagnosis, Rutter had her lung removed before the cancer could spread and has a positive prognosis, a relative rarity among lung cancer patients.

“The minimally invasive procedure I went through enabled me to get diagnosed much sooner and begin my recovery sooner,” said Rutter. “The new procedure performed by Dr. Musani certainly saved me a lot of misery.”

Specialized B Cell May Help in Fight Against HIV

There is a small group of HIV patients whose immune systems have done what few have been able to accomplish: effectively fight the virus and stay healthy for two decades and more. A recent discovery by Associate Professor of Immunology Raul Torres, PhD, and his colleagues points to a possible cause of these patients’ disease-fighting success and an HIV vaccine.

An immune-system cell known as a marginal zone B cell serves as the adaptive immune system’s early responder. It bridges the gap between the fast-acting innate response, which can begin within hours of an infection, and the highly targeted adaptive response, which can take a week or more to fully engage.

Dr. Torres identified several different molecules that trigger the marginal zone B cell’s rapid response. He also found that these B cells produce an antibody that is particularly effective against bacterial and viral infections. Because these antibodies also have other characteristics similar to those produced by the long-lived HIV patients, Dr. Torres believes marginal zone B cells may be the ones mounting an effective defense against HIV.

He has recently received a grant from the National Institutes of Health to test that hypothesis. If it proves true, Dr. Torres’s discovery of molecules that stimulate those B cells may prove helpful in developing a successful HIV vaccine.
Montelukast (Singulair) is one of the most widely prescribed medications for asthma and allergies. It works by blocking the action of chemicals called leukotrienes, which contribute to inflammation in the lungs. However, it works for only some asthma patients.

“When looking at a general population of patients, montelukast does not appear to be very effective,” said Nathan Rabinovitch, MD, Associate Professor of Medicine. “In reality, some patients respond well, while many do not. That means millions of patients are needlessly buying and taking a medication that provides no benefit. Others are going through a time-consuming and potentially hazardous trial-and-error process to find an effective medication.”

Dr. Rabinovitch wanted to find a way to predict which patients would respond to the drug and which ones would not. Dr. Rabinovitch and his National Jewish Health colleagues had previously shown a significant relationship between increases in leukotriene E4 (LTE4) and loss of asthma control. As a result, they believed they could identify patients for whom montelukast is most effective if they had a test to precisely measure urinary LTE4 levels. They sought help from the Mass Spectrometry Laboratory and the Molecular Diagnostics Laboratory (MDx) at National Jewish Health.

Led by Preveen Ramamoorthy, PhD, the MDx began operation in early 2008 and is focused on developing and delivering three main types of molecular diagnostic tests. One will detect individual genetic variations in patients to help determine the right medications for the right patient, a hallmark of personalized medicine. A second type of test will diagnose respiratory infections by detecting the genetic signature of viruses or bacteria, such as the flu, pneumonia, and the common cold in sputum samples taken from patients. The third type of molecular diagnostic test will identify genetic risk factors individual patients may have for different diseases, which can guide diagnostic testing and preventive measures.

“The application of this type of targeted therapeutic approach could lead to significant safety benefits for the individual patient with asthma in addition to substantial cost-savings for society.”

The MDx is just one of the labs that makes up the Advanced Diagnostic Laboratories (ADx) at National Jewish Health, which take advantage of National Jewish Health expertise to provide a wide array of diagnostic tests and assays, including complex immunological, respiratory, mycobacteriological complement and pharmacokinetic tests.
“We have been very fortunate to tap the extraordinary expertise here at National Jewish Health to develop a host of diagnostic tests available nowhere else in the world,” said Ron Harbeck, PhD, Medical Director of the labs. “We are constantly developing new tests to take advantage of emerging knowledge.”

The Mass Spectrometry Laboratory, led by Assistant Professor of Immunology, Nichole Reisdorph, PhD, can identify biomolecules in a complex sample by measuring their exact weight. Michael Armstrong, a senior researcher in Dr. Reisdorph’s laboratory used mass spectrometry to accurately and precisely measure LTE4 in urine, which offered great improvements over previous methods. Dr. Reisdorph, Mr. Armstrong, and the MDx are converting the mass spectrometry method into a commercial test.

Using that test, Dr. Rabinovitch and his team found that measuring LTE4 and exhaled nitric oxide, a measure of lung inflammation, could help predict which patients would respond well to montelukast. He also showed that girls and children exposed to secondhand smoke responded particularly well to montelukast.

“We believe that development of this sensitive and specific LTE4 test will allow doctors to prescribe montelukast to those who will benefit most from this medication,” said Dr. Rabinovitch. “The application of this type of targeted therapeutic approach could lead to significant safety benefits for the individual patient with asthma in addition to substantial cost-savings for society.”

Cardiology Program Grows

The Division of Cardiology has enjoyed brisk growth in its first full year, increasing its services, patients, and faculty. The division took over all internal echocardiograms, general and vascular ultrasounds, and electro-cardiogram services. It added new services including, cardiac stress testing and 24-hour ambulatory blood pressure monitoring.

The department is also taking advantage of the new Institute for Advanced Biomedical Imaging™, which allows myocardial viability testing, cardiac MRI, cardiac CT angiography, and coronary calcium scoring tests.

“We have already added two new cardiologists and are actively recruiting for three more,” said Howard Weinberger, MD, Head of Cardiology. “As our staff grows we will meet more of the significant demand from physicians outside National Jewish Health for consultation, evaluation, diagnostic testing and treatment.”

Preveen Ramamoorthy, PhD, (far left), head of the newly launched Molecular Diagnostics Laboratory, worked with Associate Professor of Pediatrics Nathan Rabinovitch and Nichole Reisdorph, PhD, (not pictured), head of the Mass Spectrometry Laboratory, to develop a new diagnostic test that can help predict which asthma patients will respond to the medication montelukast and who will not.
**TOBACCO, WEIGHT MANAGEMENT PROGRAMS REAP DIVIDENDS**

Quitline and FitLogix™ seek behavioral change to prevent premature death

In September 2007, *The New England Journal of Medicine* stated that the greatest opportunity for better health in America lay not in improving the healthcare system, developing better technology or making genetic discoveries. It will happen by changing personal behavior that is directly related to 40 percent of premature deaths in the United States. Tobacco use and obesity are far and away the leading behavioral causes of premature death, accounting for more than 800,000 deaths each year.

National Jewish Health is addressing these unhealthy behaviors with two programs, Quitline and FitLogix™, which empower people to kick their tobacco addiction and improve their well being by eating better and exercising more. Results show that these science-based programs are saving money and improving health.

“We are using the latest information from published literature and research here at National Jewish Health to help people change their unhealthy behaviors,” said David Tinkelman, MD, Vice President of Health Initiatives. “We are changing lives.”

National Jewish Health operates Quitlines for the states of Colorado, Ohio, Idaho, Montana, Iowa and New Mexico, as well as for several individual companies and health plans. Statistics show that only three to five percent of smokers are able to successfully quit tobacco on their own. Of the 370,000 smokers who have used National Jewish Health Quitline services in the past 6 years, 34 percent report successfully avoiding tobacco for a year.

FitLogix™, launched in January 2008, relies on customized personal coaching, Internet education and support, and wireless activity monitors and scales to help people lose weight. Since inception, participants have lost an average of seven and a half pounds. Those who stay with the program longer than six months are losing 12 pounds on average.

*New England Journal of Medicine, Volume 357:1221-1228*
“Our programs are successful because we focus on many aspects, including psychology, to achieve lasting change.”

“Many people quit smoking or go on a diet for a week or two and then give up,” said Dr. Tinkelman. “Our programs are successful because we focus on many aspects, including psychology, to achieve lasting change.”

Quitline and FitLogix coaches understand that each individual faces unique challenges in changing behavior. They address habits and behaviors that have kept participants from achieving long-term success, and search for specific strategies and motivations that will help them change their habits for good.

“Motivation plays an enormous role in the success of people kicking addictions and changing behavior,” said Heather LaChance, PhD, Assistant Professor of Medicine. “The techniques we use to increase motivation, and the feedback and support that our counselors provide, separate our programs from others.”

Data indicate that FitLogix and Quitline customers are indeed improving their health. FitLogix customers are making fewer health insurance claims than they did before they lost weight. Additionally, recent estimates place the cost of tobacco use at nearly $3,200 per year per smoker in healthcare costs, as well as lost income and productivity. With more than 125,000 successful quitters, Quitline has cut tobacco-related costs millions of dollars every year.

“By changing people’s behavior we have been able to improve the quality of life for tens of thousands of people and reduce healthcare costs” said Dr. Tinkelman. “That is what personalized, preventive medicine is all about.”

NEW TRIALS SPUR HOPE IN FIGHT AGAINST TUBERCULOSIS

After decades of neglect, research into new tuberculosis (TB) medications has rebounded in recent years, and National Jewish Health is contributing to several new programs.

“Right now the picture for TB drug development is the best it has been in 30 years,” said Charles Peloquin, PharmD, Director of the Infectious Disease Pharmokinetics Laboratory. “It needs to be, because today we are losing the war against TB.”

After a long period of neglect, research into new TB medications revived in the early 1990s when the AIDS epidemic triggered a surge in TB. In recent years, Dr. Peloquin’s research contracts and grants have more than tripled. Today, he is involved in three major projects to improve existing medications and find new ones.

The National Institute of Allergy and Infectious Diseases is funding projects to develop new medications and to reevaluate optimal dosing of current drugs.

The Bill and Melinda Gates Foundation has funded a similar program which seeks to learn if different dosing regimens, especially much higher doses, can reduce the treatment period from six months to two weeks. The long-treatment period contributes to the drug-resistance problem. People often begin to feel better after a few weeks, then stop taking their medications, leaving alive the drug-resistant organisms to regrow.

The TB alliance, a non-profit organization devoted to TB drug development, is funding trials of new medications and using an innovative method to evaluate them. Instead of testing one new drug at a time, which can take many years to generate results, the TB alliance is funding trials to test many new combinations at once, which will generate useful information much more quickly.
**WHY CAN’T I EAT?**

Clinical collaboration helps patients find relief for bewildering disease

Spend any time with 19-year old Mikka White and you’ll find her engaging personality and positive outlook on life contagious. You would never imagine that throughout her childhood this same young woman averaged two emergency room visits per week, and was told consistently that her symptoms were all in her head. Even today she must avoid major food groups because she suffers from a rare condition known as eosinophilic esophagitis, which can make it almost impossible to eat.

“The impact eosinophilic esophagitis (EoE) has on patients and their family’s quality of life is so profound that it really moves you to want to help them,” said Dan Atkins, MD, Professor of Pediatrics. “Many struggle just to get an accurate diagnosis, much less an effective treatment.”

In January 2008 Drs. Atkins and Glenn Furuta, of The Children’s Hospital in Denver, established the Gastrointestinal Eosinophilic Diseases Program to diagnose and treat this potentially life-threatening disease. It is one of only a handful in the nation and the only one within a thousand miles of Denver. In its first few months of operation, patients from around the nation have come to the clinic, physicians from across the country have come to observe the program, and scientists have begun basic and translational research studies.

“We have a three-pronged approach with focus on clinical, educational, and research improvements,” said Dr. Furuta. “This is the beginning of important and wide-ranging work. The establishment of this clinic puts National Jewish Health and Children’s Hospital on the cutting edge of research and clinical work.”

Eosinophilic esophagitis (EoE) is characterized by swelling of the esophagus (the part of the body connecting the throat and the stomach) caused by an immune-system cell, the eosinophil, and is often associated with severe food allergies. Symptoms of EoE can range from severe heartburn, to difficulty swallowing, nausea, vomiting, food stuck in the esophagus, and weight loss. The difficulty swallowing can often be so severe that patients can not even swallow medication.

Because many EoE symptoms are often associated with other gastrointestinal diseases, and EoE is not widely recognized, many patients go years before they are accurately diagnosed.

“It was terrible, nobody outside of my family believed that the pain I felt was real,” said Mikka. “My health was deteriorating and I had no answers, no solutions. Worst of all, I had no idea what was going on inside my body.”

After suffering for eleven years with progressively more severe symptoms Mikka finally got a break when her brother-in-law, Landon Edwards, a third-year medical student at the time, recognized her symptoms during a lecture on EoE, and sent her to Dr. John Udall Jr., MD, Chairman of Pediatrics and Gastroenterology at...
Mikka White averaged two visits per week to the emergency room before coming to National Jewish Health for treatment of her eosinophilic esophagitis. In the months since seeing Dan Atkins, MD, and other members of the Gastrointestinal Eosinophilic Diseases Program at National Jewish Health and the Children’s Hospital of Denver, Mikka has stayed out of the hospital and added several foods to her diet.

EoE often comes with many complicating health issues. Because of the difficulty swallowing, children can become malnourished and, in some extreme circumstances, need feeding tubes. From a psychological standpoint, the disease subjects the entire family to tremendous amount of anxiety and stress.

“This clinic is a model of cooperation between two world-class organizations that are working together to benefit children and young adults,” said Dr. Atkins. “Being able to combine our resources and expertise allows us to focus on individualized care and treatment of the entire family. Already we have made strides in the quality of treatment and the quality of life for patients and their families.”

In just a few months of working with Dr. Atkins, Dr. Furuta and other members of the team, Mikka has stayed out of the emergency room and added several foods to her diet.

“I feel so much healthier and have more energy than I can ever remember,” said Mikka. “I am able to take charge of my condition and live my life.”

West Virginia University, Dr. Udall diagnosed Mikka with EoE and referred her to Dr. Atkins at National Jewish Health. Weeks later Mikka and her mother drove from their home in West Virginia to Denver for treatment in the program.

Study Seeks Treatment for Food Allergies

Twenty-one-year-old Allison Rush knows all too well about the constant fear that comes with food allergies. She can never be sure that her next bite won’t cause a severe allergic reaction that sends her to the hospital. That’s why Allison was happy to volunteer for a clinical study aimed at preventing allergic reactions to food.

National Jewish Health researchers are feeding peanut-and egg-allergic people increasing doses of a protein extract from the foods to see if they can induce the patients’ immune systems to tolerate the food.

“Right now, the only advice we can give to our food-allergic patients is to avoid the foods and be prepared to react quickly if they do mistakenly consume them,” said David Fleischer, MD, principal investigator for the studies. “We hope these trials will lead to the development of the first preventive treatment for food allergies.”

National Jewish Health is participating in this research as part of the Consortium of Food Allergy Research, a network of academic medical centers funded by the National Institute of Allergy and Infectious Diseases.

“It is exciting to think that if this works I will not have to worry nearly as much about my peanut allergies,” said Rush.
Pick up a piece of the metal beryllium and it feels so light you might think it is plastic. But it is strong and stiff enough to harden metal alloys. This combination of lightness and strength makes beryllium useful in a wide range of applications including computers, cell phones, automobile parts, aerospace and defense. It is not harmful in its solid form, but can cause a deadly disease when inhaled as dust or fumes.

National Jewish Health has more expertise with chronic beryllium disease than any other US center. Lisa Maier, MD, MSPH, Head of the Division of Occupational & Environmental Health Sciences, leads the National Jewish Health beryllium program. In the past year, Dr. Maier reported several discoveries that have highlighted the dangers of beryllium, and pointed to more effective treatments.

Chronic beryllium disease is an inflammatory lung disease. After inhaling tiny amounts of beryllium, some people become sensitized to the substance. Their immune systems recognize the metal and are on ‘heightened alert.’ However, patients have no symptoms. A minority of those sensitized people develop full-blown chronic beryllium disease, which causes progressive scarring of the lungs.

Dr. Maier highlighted how even a little exposure can cause beryllium disease when she identified eight people in Reading, Pennsylvania, who developed chronic beryllium disease even though they had never worked at the nearby beryllium manufacturing plant. The plant no longer exists, and current production facilities are held to much tighter standards. However, Dr. Maier’s paper shows that patients can develop the disease even years after they were last exposed to the metal, and that there are almost certainly more people living in Reading, and possibly other communities, who have undiagnosed beryllium disease.

“There are probably more than 800,000 people in the United States at risk for beryllium disease, yet I commonly see beryllium patients whose lung disease was misdiagnosed for years,” said Dr. Maier. “I hope this study will spur more physicians to think about beryllium disease as a potential cause of their patients’ breathing difficulties.”

Since beryllium disease results in excessive scarring of the lungs, Dr. Maier thought a gene associated with deposition of scar tissue, TGF-ß1, might play a role in the disease. It does, but in an unexpected manner. Patients who had genetic variants associated with lower levels of the TGF-ß1 protein, and thus less potential scarring, were more likely to develop severe disease. Dr. Maier hypothesized that a newly recognized immune regulatory function of TGF-ß1, rather than its role as a scar promoter, contributes to the severe beryllium disease.

“That was a surprise. It has redirected our research to look more closely at immune dysregulation as part of the disease process,” said Maier.

Dr. Maier, in collaboration with Professor of Immunology Brian Day, PhD, also discovered a possible therapeutic approach: antioxidants. They found that beryllium disease patients had low levels of antioxidants inside their cells. Treatment with antioxidants reduced the proliferation of T cells and lowered levels of molecules known as cytokines, both of which contribute to the disease.

“This suggests that oxidative stress plays a role in the beryllium disease process and that treatment with antioxidants could inhibit progression of the disease,” said Dr. Maier. “It has been an extraordinary year. I feel like we are making remarkable progress learning about the disease process and possible therapeutic approaches.”
When Professor of Medicine, Cecile Rose, MD, asked Wayne Watson if he ate much butter-flavored popcorn, he thought it was a question completely out of left field. How could she possibly have known that he was a microwave-popcorn fanatic, eating two or three bags a day for years? But that question and the subsequent diagnosis of bronchiolitis obliterans, or popcorn lung, did not come out of left field; it was the direct result of several years working with the flavoring industry to reduce workers' exposure to the synthetic butter flavor chemical, diacetyl.

After diacetyl was identified as the probable cause of several cases of severe lung disease in workers at flavoring and microwave popcorn plants in the early 1990s, the flavoring industry sought help from Dr. Rose and John Martyny, PhD, Associate Professor of Medicine, in understanding and coping with the problem. Drs. Rose and Martyny delivered several seminars to the industry, then visited many plants, where they screened workers for potential disease and recommended changes to reduce exposures.

“My diagnosis of Wayne Watson was a direct result of the years I spent working on the problem of occupational exposure to diacetyl,” said Dr. Rose. “While I am very pleased that we could determine the probable cause of Mr. Watson’s lung disease, I am especially proud that we were able to help companies better protect their workers by reducing their exposure to this potentially hazardous substance.”

Lisa Maier, MD, (page 20) made several discoveries in the past year that have highlighted the dangers of the extraordinary metal beryllium and pointed to more effective treatments for chronic beryllium disease, a potentially fatal, progressive, scarring disease of the lungs. John Martyny, PhD, and Cecile Rose, MD, worked for years helping the flavoring and popcorn industries reduce workers’ exposures to the hazardous chemical diacetyl before Dr. Rose diagnosed Wayne Watson with “popcorn lung.”
It can be difficult enough to have a fatal disease such as idiopathic pulmonary disease (IPF). But imagine the questions that would arise if you learned that you also have one of the two genes associated with an inherited form of the disease. Have you passed that gene onto your children? Will they get the disease? Should they have children?

These are some of the important and challenging questions that National Jewish Health genetic counselor Janet Talbert hears every day as she answers the phone calls that come into the first genetic counseling program for families affected by idiopathic pulmonary fibrosis.

“People hear about a gene associated with idiopathic pulmonary fibrosis and they get very worried that they or their children are doomed,” said Talbert. “Genetic testing, however, rarely offers a clear, black-and-white answer.”

The genetic counseling program arose out of discoveries reported in 2007 of two genes associated with the familial form of idiopathic pulmonary fibrosis. Soon after, tests became publicly available that could tell if a person carries either of those two genes. National Jewish Health and the Coalition for Pulmonary Fibrosis were concerned that people would get these tests without having access to important information that could help them make informed decisions about planning their lives after learning the results of those tests, or even whether to get tested. So, they created the genetic counseling line in February 2008, with Talbert, a trained genetic counselor knowledgeable about IPF, as the point person to answer questions and provide education.

Most callers fall into one of two main groups. They are either people with IPF who wonder if they have passed the gene onto their children or they are the children of patients with IPF who wonder if they carry the gene and will get the disease.

“These people are grappling with very important decisions,” said Talbert. “I try to explain exactly what positive and negative test results mean.”

For instance, if you have the gene, you have only a 50-50 chance of passing it on to each of your children. If a child does inherit the gene from a parent, there are no guarantees the child will develop the disease. Scientists believe several genes are involved in IPF. So, even if you do not have the gene, but have two or more family members with IPF, you may still face an increased risk of developing the disease. In addition, your environment probably plays a role; you may need some specific environmental exposure in addition to the genes to develop the disease.

“Both medical genetics in general and the genetics of pulmonary fibrosis in particular are rapidly evolving areas in medicine; new information appears every month. Having a genetic counselor available to help patients navigate this complex area is extremely beneficial.” said Professor of Medicine Kevin K. Brown, MD, who leads the IPF program at National Jewish Health. “Ms. Talbert offers invaluable information and assistance to these patients.”
Increased awareness that idiopathic pulmonary fibrosis (IPF) is more common than previously believed, and becoming even more common, has spurred a surge in research into the incurable and fatal lung disease. Kevin Brown, MD, leads the pulmonary fibrosis program at National Jewish Health. Genetic counselor Janet Talbert operates the nation’s only genetic counseling program for idiopathic pulmonary fibrosis.

A growing awareness of idiopathic pulmonary fibrosis (IPF) has fueled a surge in research to understand and treat this fatal and incurable lung disease. A decade ago, National Jewish Health, one of the leading IPF treatment and research centers, was participating in one research study aimed at treating the disease. Today, there are eight ongoing IPF studies with several others recently completed.

IPF is an uncontrolled and progressive scarring of lung tissue, leading to a nagging, dry cough, and shortness of breath. The cause of the disease is unknown, and there is no approved treatment for it.

“IPF was once considered an orphan disease,” said Kevin Brown, MD, leader of the pulmonary fibrosis program at National Jewish Health. “Recent research however has shown that it is more common than previously appreciated.”

Dr. Brown added to that growing awareness in late 2007 when he and his colleagues published research indicating that deaths from IPF are on the rise, especially among women. Between 1993 and 2002 the death rates increased 28 percent among men and 41 percent among women to an overall rate of 50.8 per 1,000,000 people, or about 15,000 people per year in the US. Men, however, still suffer the disease more often.

National Jewish Health is part of the NIH-sponsored IPF Clinical Research Network, which is currently conducting two studies of medications (sildenafil and N-acetylcysteine) to treat IPF. Pharmaceutical companies Novartis and Gilead are also sponsoring trials of two other experimental medications. In addition, National Jewish Health is participating in a study to evaluate the effect of a physical exercise program on IPF, one to look for biomarkers of acute exacerbations, a study to look for genetic causes of IPF, and a natural history study that includes participation in the Integrated Bioinformation and Specimen Center.

“In the past decade we have begun to make progress at understanding the disease and identifying potential therapeutic targets,” said Dr. Brown. “We need, however, to redouble our efforts against this devastating disease.”
DONORS COME THROUGH STRONG FOR REHABILITATION

New space gets state-of-the-art equipment

When the Iris and Michael Smith Clinics and Laboratories opened in early 2007, the J. Leonard and Myra Levy Rehabilitation Department moved out of its basement quarters into a bigger, brighter, and more appealing space on the second floor. In 2008, donor contributions fueled a comprehensive upgrade of the department, bringing in state-of-the-art equipment that provides better workouts for more people.

At the Beaux Arts Ball in March 2008, Michele and Marty Cohen gave $250,000 in honor of Carole and Jeffrey Schwartz, part of which will be used in the coming year to purchase new exercise bicycles, treadmills, exercise tables and cardiovascular monitoring equipment. With Alex Kaufman’s generous gift of $100,000, National Jewish Health was pleased to name the Alex Kaufman Pediatric Group Rehabilitation Room in his honor. Joyce Zeff continued her 35-year tradition of giving with a $100,000 gift, much of which purchased a variety of new resistance and aerobic exercise equipment.

“It’s been a great year,” said Jane Whalen-Price, Director of Rehabilitation Services. “The patients are just loving the new space and the new equipment.”

Technogym state-of-the-art equipment adds to the updated look and brings equipment similar to that used by Olympians at their training center in Colorado Springs and in Beijing.

The central theme for all the equipment is “functional fitness,” which uses motions similar to those people perform in their every day lives. For instance, the Technogym Kinesis, purchased with Ms. Zeff’s donation, is a wall with cables that people extend against varied resistance. The stations and cables offer a much wider range of motions than traditional exercise equipment. The routines done at these stations also strengthen the core muscles and incorporate balance into many of the exercises, an especially important feature for an older population at risk for falls.

The new Cardio Wave machine uses a leg motion similar to that used for rollerblading. Users, who make motions in two planes — horizontal and vertical — get more exercise in less time.

“This thing is the best,” said an enthusiastic Joyce Zeff as she worked out on the Cardio Wave. Ms. Zeff is a regular customer of the rehabilitation services, building up strength following replacement of both her hips. “I can get the same amount of exercise on this machine in 15 minutes that takes me 30 minutes to do on a treadmill.”

The Alex Kaufman Pediatric Group Rehabilitation Room is designed just for kids, providing a large, cheerful area separated from the adult space. Physical therapists work to improve deficits caused by orthopedic injuries, disease, disability and developmental delay.

“The new equipment and space are transforming the rehabilitations service,” said Whalen-Price. “We couldn’t have done it without those very generous donations. Our staff and patients give them a very big ‘Thank You.’”
Generous donors have helped transform the Rehabilitation Services Department into a state-of-the-art physical fitness center. New equipment stresses “functional fitness,” which uses more realistic, everyday motions to strengthen patients and improve their balance.

Special Events Break Fundraising Records

Special events in support of National Jewish Health enjoyed a record-breaking 2007-2008 season.

In San Antonio, National Jewish Health honored former San Antonio Spurs basketball star David Robinson with the 2008 Humanitarian Award at a luncheon attended by more than 300 guests, which raised over $170,000. At the luncheon, Dr. Salem announced the naming of The Robinson Family Learning and Technology Center at the Kunsberg School.

The Los Angeles Professional Services Dinner raised nearly $390,000, a record-breaking amount, in February at the Langham Huntington Hotel and Spa in Pasadena, CA. More than 460 guests turned out to honor Vicky Balmot of Wachovia Capital Finance and Robert Lewin of CIT Commercial Services.

The Financial Industries Dinner in New York also broke its previous record, raising over $670,000. More than 900 guests honored Robert J. Arth of Bank of America Business Capital. Also in New York, at the Real Estate and Construction Industries Dinner Dance, Marty Cohen, CEO and Co-Chairman of Cohen & Steers, was honored with the National Jewish Health 2007 Humanitarian Award.

Not to be outdone, the 2008 Beaux Arts Ball, “Hollywood in the Rockies,” raised a record-breaking $2.2 million. The 1,250 guests danced to the music of Hollywood star Gary Sinise and his Lt. Dan Band. Dr. Salem, National Jewish Health President and CEO, paid tribute to the Grand Marshals: Jeff and Carole Schwartz, Marty and Marie Herzog, Harvey and Sue Allon and Tom and Margie Gart.

Four hundred and fifty sports fans raised $150,000 while enjoying the NCAA basketball semi-final games during the 2008 Hoops and Hoopla at Invesco Field at Mile High in April. Team Greiner, composed of David Greiner and Kevin Eitniear of Greiner Electric, and Rick Pastor of Wesco, came away with the fundraising champion’s trophy for raising $60,000 at the event.
U.S. Engineering Company Helps at Kunsberg School

H. Tyler Nottberg listened closely as Michael Salem, MD, National Jewish Health President and CEO, and board member, J. Mariner Kemper, CEO and Chairman of UMB Financial Corp., explained the challenges and successes of the children at Kunsberg School on the campus of National Jewish Health. After learning more about the only full-time school for chronically ill children in the U.S., Nottberg realized he wanted to get involved.

“When I visited Kunsberg, I got a chance to meet the kids and teachers, and I was struck by the level commitment from the institution to improve the lives of these challenged children,” said Nottberg, Chairman and CEO of U.S. Engineering Company. “We are looking forward to contributing more than just a check. This is an opportunity for our company to become hands on, and truly partner with National Jewish Health.”

U.S. Engineering Company has pledged $80,000 to help education at Kunsberg. The money will be used to fund critical educational needs at the school.

The Kunsberg School is a K-8 day-school for students whose chronic diseases have caused them to miss so much school that they have fallen behind academically. Students learn specific self-care practices, which enable them to monitor their own illnesses and lead productive, meaningful, active lives. The school is approved by the Colorado Department of Education, and there is no charge for students to attend. The goals of the educational program are to help students achieve academic and physical excellence and to prepare them to become independent, self-reliant and responsible.

“The generous support from U.S. Engineering will help fund our reading curriculum, laptop computers for teachers, student transportation needs and enhanced teacher training and professional in-service programs,” said John Reid, Kunsberg School Director. “Tyler and his colleagues at U.S. Engineering have shown they are committed to the students at Kunsberg, and we are truly appreciative.”

John Reid (left), Director of the Kunsberg School for chronically ill children on the main campus of National Jewish Health, and his students will benefit from a generous donation made by U.S. Engineering. H. Tyler Nottberg, CEO of U.S. Engineering (upper left, with Michael Salem, MD, CEO and President of National Jewish Health), said he was inspired to contribute when he visited the school and saw the extraordinary commitment National Jewish Health makes to changing and improving the students’ lives.

Chairs and Fellowships

We recognize the following donors for their substantial commitment to biomedical research and education through the endowment of chairs, professorships and fellowships, and the faculty and staff who occupy these distinguished positions.

### Endowed Chairs

- The Carole and Albert Angel Family Presidential Chair
  - Professors: Michael S. Salem, MD, FACS, President and CEO
- Girard & Madeline Beno Chair in Mycobacterial Diseases
  - Professors: Michael D. Isaman, MD, Professor, Division of Mycobacterial and Respiratory Infections, Department of Medicine
- Irene J. and Dr. Abraham E. Goldminz Professor of Immunology and Respiratory Medicine
  - Chair under funding
- Ida and Cecil Green Professor of Cell Biology
  - Professors: John C. Cambier, PhD, Chairman, Integrated Department of Immunology
- The Catherine Kramer Professor of Clinical Mycobacteriology
  - Professors: Leonid B. Heifets, MD, PhD, Director, Mycobacteriology Reference Library, Department of Medicine
- The Catherine Kramer Scientist in Pediatric Medicine
  - Professors: Donna L. Bratton, MD, Associate Professor of Pediatrics, Division of Allergy
- Marjorie and Stephen Raphael Chair in Asthma Research
  - Chair appointment under consideration
- Margaret A. Regan Professor of Pulmonary Inflammation
  - Professors: Rafeul Alam, MD, PhD, Professor of Medicine and Head, Division of Allergy and Clinical Immunology
- William H. and Chauncey H. Ritter Chair in Clinical Immunology
  - Professors: Robert J. Mason, MD, Professor and Associate Vice President, Academic Affairs, Director, Environmental Lung Center
- Cetale & Marcel Weiss Chair in Pulmonary Medicine
  - Professors: Stanley J. Szefler, MD, Head, Pediatric Clinical Pharmacology, Director of Pediatric Clinical Trials Center, Co-Director of the Weinberg Clinical Research Unit, Department of Pediatrics
- The Drs. Harold & Mary Zirin Chair in Pulmonary Biology
  - Professors: Greg P. Downey, MD, FRCP, Executive Vice President for Academic Affairs and Professor, Departments of Medicine, Pediatrics and Immunology

### Annual Chairs

- Edelstein Family Chair in Adult Pulmonary Medicine
  - Professors: Richard J. Martin, MD, Professor and Chair, Department of Medicine
- Edelstein Family Chair in Pediatric & Clinical Immunology
  - Professors: Donald Y. M. Leung, MD, PhD, Professor, Head, Division of Pediatric Allergy and Immunology
- Rebecca Runyon Bryan Chair in Cystic Fibrosis
  - Professors: Jerry A. Nick, MD, Associate Professor, Department of Medicine

### Endowed Fellowships

- Robert William Gitzen, Jr. & Christopher Peter Gitzen Fellowship in Basic Immunology
- Janet S. Lewald Fellowship in Basic Immunology
- The Bettina Garthwaite Lowerre Fellowship in Mycobacterial Research
- Helen Wohlberg & Herman Lambert Fellowship in Cancer Biology
- Young Family Endowed Fellowship for Pulmonary Diseases
  - (under funding)

### Honorary Fellowships

- Arnold & Sheila Aronson Fellowship in Pediatric Pulmonary Medicine
- Priscilla Campbell Memorial Award
- Vernon Dale Fellowship in Pediatrics
- Melvin Garb Endowed Fellowship in Basic Immunology
- Andrew Goodman Fellowship in Medicine
- Andrew Goodman Fellowship in Pediatrics
- Great West Life Assurance Fellowship
- Ferd O. Lawson, Jr. Fellowship in Clinical Immunology
- James F. Murray Pediatric Fellowship

### Annual Fellowships

- Michael & Eleanor Stobin Pediatric Fellowship
- Viola Vestal Coulter Foundation Scholarship
- Young Family Fellowship for Pulmonary Diseases
**Private Philanthropic Funds & Laboratories**

**Auxiliary Chapters**

Everyday, somewhere in the United States, our auxilians do something to help National Jewish Health. Over 1,000 individuals, belonging to 18 chapters in 7 states, help raise funds and secure national recognition and public awareness for National Jewish Health and its services. These individuals generously give their time, talents and resources to help others they will never know. Some join because they have been helped personally by National Jewish Health. Some participate because a member of their family suffers from chronic illness. Others participate for the joy of it.

Although they come from all walks of life and represent diverse religious beliefs, our auxilians have one common goal — to ensure that the expertise of National Jewish Health is made available to all who suffer and seek its help.

Over the 80 plus years the auxiliary chapters have been in existence, they have not only served as fundraisers, but have provided education and public relations to communities around the country. Because our auxilians believe so strongly in our mission, many include personal gifts through bequests and trusts.

Our chapters would love to have you and others you know join them as members or participate in their special events. Also if there is not a chapter in your community, we would be delighted to work with you in establishing an auxiliary group. If you or someone you know would like information on auxiliary chapters in your area, please call Terrie Baros, 1-800-423-8891, extension 1064.

**National Volunteer Board, 2007 – 2008**

An eight-member board manages the auxiliary chapters. Its purpose is to render assistance to the chapters and to help establish and implement operating policies and procedures.

Elaine Berman – Pembroke Pines, FL  
Ross Caplan – Lake Grove, NY  
Myra Shaps – Sunny Isles Beach, FL  
Sheila Stern – Lake Worth, FL  
Merna Sternfeld – Skokie, IL  
Claire Surval – Jackson Heights, NY  
Beryl Yaffa – Los Angeles, CA  
Lucille Zakroff – Sunny Isles Beach, FL
Honor Roll of Philanthropy Annual Giving Circles (July 1, 2007 – June 30, 2008)

The following philanthropic circles recognize this year’s most esteemed donors. In 2008, each of these individuals, foundations and corporations helped National Jewish Health create a collaborative, multidisciplinary environment that fosters creative solutions to chronic respiratory, allergic and immune diseases. These donors have made many of this year’s accomplishments possible.

**Explorer’s Circle**
$1,000,000-$2,499,999
- Estate of Lewis Humphreys

- Takeda Pharmaceuticals North America, Inc.
- Weisbart-Pomeranz Foundation
- The Kal & Joyce Zeff Family Foundation

Honor Roll of Philanthropy Lifetime Achievement Societies (As of June 30, 2008)

The Frances Wisebart Jacobs Founder’s Society, The Chairman’s Society and The President’s Society recognize and honor the lifetime giving of individuals, foundations and corporations. National Jewish Health pays tribute to those who have helped make this a world-class institution. Their dedication to National Jewish Health inspires others to give philanthropically and helps us shape the future of science and medicine.

**Frances Wisebart Jacobs Founder’s Society** ($10,000,000+)

The 2008 financial report reflects challenges associated with the economic turmoil. National Jewish Health recognized more than $8.9 million in unrealized portfolio losses during the fiscal year. Similarly, state budget shortfalls resulted in unexpected declines in certain Health Initiatives programs. As a result, total net assets decreased $8.8 million.

At this same time, it is important to recognize that great progress was made in achieving the goals of the strategic plan. Clinical revenues increased more than 24 percent, from $49.1 million to $60.7 million. Total patient visits increased almost 30 percent, and new patient visits increased 27 percent. The scope of the clinical program expanded with the addition of new programs in gastroenterology, interventional pulmonology, cardiology, and a hospitalist program; the addition of new clinical sites in South Denver, and Highlands Ranch; and the significant expansion of clinical infrastructure with the opening of the Minimally Invasive Diagnostic Center and the Institute for Advanced Biomedical Imaging™.

Thanks to our loyal donors from around the country, the fiscal year ended June 30, 2008, was one of the most successful in the history of National Jewish Health. In total, more than $21 million was raised, net of fundraising expenses.

Research revenues increased 5 percent during the year, in spite of the flat National Institutes of Health budget. In 2008, National Jewish Health received a large, 5-year grant through the National Institutes of Health entitled “Genetic Epidemiology of COPD.” This grant involves 23 organizations throughout the United States. National Jewish Health is the coordinating center in conjunction with Brigham and Women’s Hospital. The total grant award over the 5-year term is $27.5 million. This study will add $2.6 million in indirect reimbursement to National Jewish Health over its 5-year term.

Consistent with the strategic plan, National Jewish Health made significant investments in both its infrastructure and its faculty. This investment will enable the clinical programs to continue being unique in terms of healthcare delivery, but to become more financially sound over time, and will enable National Jewish Health to maintain our preeminent status in both our clinical and research endeavors.

The outlook for the U.S. economy is very concerning. Through a combination of expense reductions and revenue diversification, management is taking steps to prepare for the potential of an extended economic recession. We expect to see continued substantial demand for our services. In its almost 110 year history, National Jewish Health has weathered many economic downturns. Through prudent management and continued support from our many donors, we are optimistic that we will successfully navigate through the current conditions.

Sincerely,

Larry Silverstein
Treasurer

Charitable donations are crucial to the ongoing operation and growth of National Jewish Health. 2008 continued an excellent trend of increasing contributions, rising 11 percent over the previous year.

With new clinic space and a growing faculty, we are seeing more patients at National Jewish Health. Patient revenues continue to show a strong upward trend with a 24 percent increase in 2008.

National Jewish Health draws patients from every state in the nation and many nations around the world.

Investment in people, in the form of salaries, commands the lion’s share of expenditures at National Jewish Health.
Thanks to the following people for their invaluable contributions to the writing, photography, design and production of this annual report.

Our Mission since 1899 is to heal, to discover, and to educate as a preeminent healthcare institution.

We serve by providing the best integrated and innovative care for patients and their families; by understanding and finding cures for the diseases we research; and by educating and training the next generation of healthcare professionals to be leaders in medicine and science.
