

- Associate Professor
- Department of Pediatrics
- Division of Cell Biology

Conditions Treated:

Research Areas:

- FPF Site
- Pulmonary Fibrosis
- Interstitial Lung Disease (ILD)
- Macrophage Biology
- Fibroblast biology

Programs & Services:

- Cell Biology

My career interests are focused on the interactions between TNF- α , macrophages and myofibroblasts and their role in the resolution of established pulmonary fibrosis with the goal to investigate the mechanisms by which TNF- α resolves fibrosis as the basis for the translational application of this work as a potential therapeutic. We plan to elucidate the mechanisms by which TNF- α is reducing the pro-fibrotic phenotype of macrophages and myofibroblasts and via the creation of an anti-fibrotic lung microenvironment. The importance of understanding how macrophages are shaping the lung environment during disease and how these interactions can be modulated to influence disease resolution is an important research direction that can be applied to many diseases including fibrosis and cancer. It is my goal that my basic science findings conducted in mouse models be translatable to human disease and into potential therapeutic treatments.

Education

University of Colorado Denver, PhD

Affiliations with the University of Colorado Denver

Assistant Professor of the University of Colorado School of Medicine, Department of Medicine, Division of Pulmonary Sciences and Critical Care Medicine
