

What is the Lung Cancer Screening Program?

If caught early, lung cancer can be cured. The Lung Cancer Screening Program uses a special type of chest imaging called a CT scan to find early lung cancer. If you currently smoke cigarettes, the program also tries to help you stop smoking, because smoking is the number one cause of lung cancer.

When is screening recommended?

Screening looks for a disease before a person has symptoms. Screening is recommended if the person has high risk for disease, but has no symptoms of the disease.

Who should consider participating in the Lung Cancer Screening Program?

If you have all three of these risks (see below) experts recommend lung cancer screening.

- You are 50 to 80 years old
- You are a current or former smoker, with at least 20 pack-years of smoking
 - Pack years are determined by the number of cigarette packs per day multiplied by the number of years you smoked.
- You are a former smoker, who quit within the past 15 years.

What happens in the Lung Cancer Screening Program?

You will meet with a trained Advanced Practice Provider (nurse practitioner or physician assistant) to discuss the Lung Cancer Screening Program. You will discuss the risks and benefits of screening, then you can decide if you would like to proceed with screening.

The CT scan

- If you decide to be screened, a CT scan of the chest will be scheduled or completed during the visit.
 - During the CT scan you will lie flat on the CT table and the machine scans over your chest during one breath hold.

It is simple, easy and does not hurt.

- We will call you with the results of the CT scan and any needed follow-up plans. You will also receive a letter and a copy of your CT scan report from the radiologist. Your referring doctor will also receive a copy of the CT scan report.
- The CT scan will be repeated every year. You will receive a reminder letter to schedule the yearly CT scan.

Smoking Cessation Counseling

- If you currently smoke or you are trying to give up smoking, the nurse practitioner or physician assistant will discuss ways to help you give up smoking.
- You can schedule follow-up appointments to help you give up smoking.

What are the expectations in Lung Cancer Screening?

- You agree to have an annual lung cancer screening CT
- You recognize other abnormalities besides lung nodules can be found
- You agree to have further work-up if an abnormality is found
- You agree to pursue treatment if lung cancer is found.

What if you have possible symptoms of lung cancer?

Symptoms of lung cancer include:

- Coughing up blood
- Weight loss without trying.

If you have these symptoms you will need to be seen by a pulmonary doctor.

How long will you be involved in the Lung Cancer Screening Program?

You will have yearly CT scans until you reach age 77 to 80 years or it has been more than 15 years since you quit smoking.

What is the cost of the Lung Cancer Screening Program?

Private insurance, Medicare and Medicaid pay for lung cancer screening as a preventive service without a co-pay in eligible people. New guidelines for Lung Cancer Screening recommend starting screening at age 50 (previously it was age 55) and a minimum history of smoking of 20 pack years (previously the minimum was 30 pack years). Not all insurance providers have adopted the recommendations yet. During this transition time, we will work with your insurance to try to get approval if you meet these new eligibility criteria. If your insurance has not adopted the new criteria, you may qualify for a lung cancer screening CT scan on a self-pay basis for a reduced rate of \$250.

If your lung cancer screening CT shows abnormalities, you or your insurance company may have to pay for additional medical tests or treatment.

Frequently Asked Questions

These are questions people often ask about the Lung Cancer Screening Program.

I have a lung nodule. Is this worrisome?

- A lung nodule is a small rounded spot on the CT scan.
- Lung nodules are common. More than 95 out of 100 lung nodules are not cancerous, and will stay the same size, get smaller, or disappear. Some lung nodules may grow on a follow-up CT which can be an early sign of lung cancer.

The goal of the Lung Cancer Screening Program is to identify lung cancer early when it is small and at a curable stage.

I have a suspicious lung nodule. What will happen next?

If you have a lung nodule suspicious for early lung cancer, we will contact you directly. You can be referred to one of the National Jewish Health lung nodule specialists, or your regular doctor can help to coordinate the next steps. Further diagnostic tests may be needed--such as special imaging scans, a lung biopsy, or surgery.

What if abnormalities are found on the CT scan that are outside the lung?

The chest CT includes images of part of the neck with the thyroid gland, other chest organs (heart, esophagus) and part of the kidneys, pancreas, stomach and liver. Sometimes abnormalities are found in these organs that need additional testing to determine if they are serious. If you like, National Jewish Health specialists can evaluate these abnormalities and you can arrange for follow-up with your primary care doctor.

What are the harms of getting a screening CT scan?

A CT scan exposes you to radiation. (see below). A lung cancer screening CT may show abnormalities that can lead to more imaging studies, medical tests, and costs to you or your insurance company.

Is the radiation I'm exposed to during a CT scan a concern?

We are all exposed to natural radiation in our environment. Medical imaging tests, like a screening CT scan, expose a person to slightly more radiation. This exposure is higher than background natural radiation. The amount of radiation in our lung cancer screening CT is considered safe. While there is no firm evidence that radiation from CT exams causes cancer, there is always a concern that increased radiation exposure may increase cancer risk. In the program we work to keep the radiation exposure to the lowest possible level that will allow us to perform effective screening.

The Lung Cancer Screening CT scans at National Jewish Health are performed at the lowest dose possible and is considered to be very safe.

Questions to ask my health care provider

If you are being seen at National Jewish Health, if you have further questions please ask. You can also call 303.270.2551 or 877.713.5066 and leave a message and call back number.
