

National Jewish Statement Regarding Serevent

JANUARY 24, 2003

DENVER — Serevent is an effective drug for the treatment of both asthma and chronic obstructive pulmonary disease (COPD) when used appropriately.

Previous research has indicated that a very small number of asthma patients may be at increased risk for adverse effects from the medication. A warning to that effect has been on medications containing Serevent for more than a year.

We are aware of no new data indicating a greater risk than has already been identified and highlighted. We are aware of no data indicating an increased risk for COPD patients taking Serevent.

All asthma patients taking Serevent should also be taking an inhaled steroid.

Patients who are doing well on Serevent, should continue using it. Patients who feel that their asthma symptoms are worsening should contact their physician.

Patients should never stop using Serevent or any other asthma medication without consulting their physician.

Untreated asthma poses a greater risk than the potential risk posed by Serevent.

Serevent is a *long-acting* beta agonist controller therapy and should not be used as a rescue medication. Patients taking Serevent should continue to have available *short-acting* beta agonists, such as albuterol, as their rescue medication.

Patients who are just beginning to take Serevent should experience a benefit within a short time. If not, they should talk to their physician.

National Jewish Health is the leading respiratory hospital in the nation. Founded 121 years ago as a nonprofit hospital, National Jewish Health today is the only facility in the world dedicated exclusively to groundbreaking medical research and treatment of patients with respiratory, cardiac, immune and related disorders. Patients and families come to National Jewish Health from around the world to receive cutting-edge, comprehensive, coordinated care. To learn more, visit the [media resources page](#).
